

Easy Cut Metal Cleaner

Metal cleaner for multiple types of bare metal surfaces

Sizes Available:
16oz. (BXMPEC-16)
8 oz. (BXMPEC-8)

Detail: Cleans light to heavy oxidation easily from bare metals such as aluminum, brass, copper, magnesium, gold, silver, and blended metals. Removes harsh staining from stainless steel. Removes surface rust from chrome quickly. Easy Cut contains a combination of solvents, chemicals that react to break down oxidation, slip components, and extremely fine abrasives. Together, these components work to quickly remove most surface problems from the metals previously mentioned. What used to take hours to clean with most currently available metal cleaners can be done in minutes with relative ease and amazing results. The most amazing performance for Easy Cut comes from cleaning aluminum. Even the nastiest oxidation comes off with little effort. For example, a polished aluminum mag wheel that has not been polished in years and has weathering oxidation that makes it look white can be cleaned to a bright polished finish in just minutes without feeling like your arms will fall off! A great attribute of this product is that it is designed to dry completely before wiping off the polishing residue and it can be used on warm to medium hot surfaces. This means that if you polish a surface you do not have to rush to get it off. Most products require quick removal of the residue or it will be a nightmare to get off and often resulting in re-polishing the surface. This product was originally designed for aluminum but has performed incredibly for problems on other metals. But, its ease and speed at cleaning polished aluminum is nothing short of amazing. For very badly oxidized surfaces it is recommended that the Easy Cut process is repeated a second time because most of the material that gets removed in the first application contaminates the product. This second application in this instance makes a dramatic difference in the appearance of the surface. Easy Cut should be followed up with Final Shine metal polish when cleaning polished aluminum for an almost chrome like finish. Not for use on plated or anodized metals (will remove this type of coating).

Directions for use: Shake container well and often before and during use! Make sure all solids have been released from the bottom of the container before and during use to maintain consistency. Failure to do this will produce inferior results! Apply small amounts to a soft cloth (terry cloth, etc.) and rub into surface with medium pressure. On metals such as aluminum, brass, or copper, rub until product turns black. On chrome or stainless steel rub into metal until stains are gone. Let dry completely to a grayish haze. With a dry cloth, remove surface residue completely. On Aluminum we recommend applying Easy Cut twice because material that has been removed from the surface was blended with the product in the first application. This second application will insure a perfectly clean surface. Not for use on painted or clear coated metals.
